

AUTISM ASSESSMENT SCALE

According to the *Diagnostic and Statistical Manual of Mental Disorders (DSM-5)* autism spectrum disorder (ASD) has been described with three categories of severity. At-home tests are opportunities for data collection and the results can be incredibly helpful for a professional who can accurately diagnose and grade autism. [1] Many children with ASDs may not be able to describe their health state reliably due to cognitive and behavioral impairments that lead to theory of mind deficits, and thus researchers must rely on parent or clinical observation for useful information. [8]

Parents can watch their child and rank symptoms like the following:

- Irritability
- Poor communication skills
- Hyperactivity
- Anxiety
- Low sociability [1]

At-home tests, such as the **Observable Behaviors of ASD Scale (OBAS)**, are accurate, researchers say. Parents give children scores on behaviors seen in the last 24 hours. The things they see, and the severity of symptoms they indicate, give experts very helpful information on what a child's home life is like. As the Child-Mind Institute explains, questionnaires are just the first step in the diagnostic process. Often, they are broad and inclusive. [1]

In reality, plenty of adults have autism. For those with technical skills, research-based tests are available. These are the same tests doctors offer patients when assessing ASD symptoms and severity, and they're available online. [1]

Before the release of the *DSM-5*, there were four diagnosis for people with ASD symptoms:

- Autistic disorder
- Asperger syndrome
- Pervasive developmental disorder
- Childhood disintegrative disorder [1]

Per the *DSM-5*, ASD comes with three levels of severity:

- Requiring support
- Requiring substantial support
- Requiring very substantial support [1]

According to the *American Speech-Language-Hearing Association*, severity levels aren't rigid. Someone with autism may face escalating severity in specific situations, such as crowded rooms. Their symptoms may be more manageable or even unnoticeable in other situations. Severity levels can also fluctuate throughout the person's lifespan. [1]

The instruments are used to describe the symptoms and impairments of autism or to assess the severity of the condition for diagnostic purposes.

ASD-specific measures

The Autism Diagnostic Interview – Revised (ADI-R) is an extended structured interview conducted with a parent or caregiver to obtain the developmental history and current behaviors of an individual aged 2 years or above. It comprises 93 items, which focus on three functional domains: language/communication; reciprocal social interactions; and restricted, repetitive and stereotyped behaviors and interests. The ADI-R is an effective tool to differentiate autism from other developmental disorders. It focuses on the core deficits of ASD. Administration and scoring normally takes 90–180 min. The ADI-R focuses on behaviors that are rare in nonaffected individuals, and results are reported in a categorical manner rather than providing scales or norms. [8]

TABLE 7. ADI-R factor loadings in two US samples

[12]

The Autism Diagnostic Observation Schedule (ADOS) is a semi-structured autism observation measure that has become the gold standard for assessing autistic behavior and diagnosing ASDs across the age span, developmental levels and language skills. It has been administered as part of autism registries (i.e., the Autism Treatment Network [ATN] initial comprehensive evaluation) and clinical trials. The ADOS Severity Score is an overall measure of autism severity that can be constructed from scores on the ADOS. The ADOS Calibrated Severity Score provides a metric to quantify ASD severity with relative independence from the child's age and IQ. The raw ADOS totals can be mapped onto a 10-point severity metric. The Severity Score ranges from 1 to 10 with scores of 1–3 indicating a nonspectrum classification on the ADOS and scores of 4 and above indicating greater severity of

autism on the ADOS. Administration and scoring of the ADOS and ADOS Severity Score generally take 30–60 min to complete. [8]

Table 7. Classification of ADOS-G items in three ranges of impact.

Range	Item	Codes
High	Showing	B9
	Shared enjoyment in interaction	B5
	Freq. of vocalization directed to others	A2
Medium	Stereotyped use of words or phrases	A5
	Unusual eye contact	B1
	Use of other's body to communicate	A6
	Pointing	A7
	Facial expression directed to others	B3
	Response to joint attention	B11
Low	Gestures	A8
	Spontaneous initiation of joint attention	B10
	Quality of social overtures	B12

[13]

The ADOS and ADI-R are both individually administered measures that focus on the core deficit behaviors of ASD; the former is administered with the person with ASD, and the latter with a parent or caregiver of the individual with ASD. [8]

The Childhood Autism Rating Scale, second edition (CARS2) is a clinician-completed behavior rating used to identify and distinguish children with ASDs from other developmental disorders, as well as to determine ASD symptom severity. The CARS2 has two different forms based on information gathered from parents or caregivers (CARS2-QPC). The two forms are **CARS2-ST**, for children younger than 6 years of age and those with communication difficulties or below-average estimated IQs, and **CARS2-HP**, which is an alternative for assessing verbally fluent individuals or children 6 years old or above, or children with IQ scores above 80. The revised edition expands the tests from the original CARS to cover high-functioning autism or Asperger's disorder. The CARS2 has 15 items that can be administered in 5–10 min. The CARS2 focuses on core deficit behaviors. Total scores can range from a low of 15 to a high of 60; scores below 30 indicate that the individual is in the non-autistic range, scores between 30 and 36.5 indicate mild to moderate autism, and scores from 37 to 60 indicate severe autism. [8]

Childhood Autism Rating Scale, Second Edition Eric Schopler, Ph.D., Robert J. Reichler, M.D., and Barbara Rutter Remmer, Ph.D. **wps** **CARS2-ST** Standard Version Rating Booklet

Name: _____ Class of Function: _____ Test Date: _____
 Gender: _____ Ethnic Background: _____ Rater's Name: _____ Date of Birth: _____
 Address or Institution Name: _____ Age: _____ Sex: _____ (M/F)

DIRECTIONS: After rating the 15 items, transfer the ratings from the inside pages to the corresponding spaces below. Sum the ratings to obtain the Total raw score, and indicate the corresponding Severity Group. Circle the Total raw score value in the table in the column labeled *At Age* and in the column that corresponds to the age of the person who has been rated. The number printed to the left of each rating you have circled is the T score.

SUMMARY

CATEGORY RATINGS

1. **Relating to People**
 median = 2.5 (2.0, 3.0)
2. **Imitation**
 median = 2.5 (2.0, 3.0)
3. **Emotional Response**
 median = 3.0 (2.0, 4.0)
4. **Body Use**
 median = 2.5 (2.0, 3.0)
5. **Object Use**
 median = 2.5 (2.0, 3.0)
6. **Adaptation to Change**
 median = 2.5 (2.0, 3.0)
7. **Visual Response**
 median = 2.5 (2.0, 3.0)
8. **Listening Response**
 median = 2.5 (2.0, 3.0)
9. **Taste, Smell, and Touch Response and Use**
 median = 2.0 (2.0, 2.0)
10. **Free or Stereotyped**
 median = 2.5 (2.0, 3.0)
11. **Verbal Communication**
 median = 3.0 (2.0, 4.0)
12. **Nonverbal Communication**
 median = 2.5 (2.0, 3.0)
13. **Activity Level**
 median = 3.5 (2.5, 4.5)
14. **Level and Consistency of Intellectual Response**
 median = 2.5 (2.0, 3.0)
15. **General Impression**
 median = 3.0 (2.0, 4.0)

Note: The numbers in parentheses are medians for individuals aged 2–12 and 13+, respectively.

Total raw score = _____ **Note: SEM = 0.08**

SEVERITY GROUP

☐ **Minimal to No Symptoms of Autism Spectrum Disorder**
 (15–29.5, 15–27.5 for ages 2–12)

☐ **Mild to Moderate Symptoms of Autism Spectrum Disorder**
 (30–36.5, 29–34.5 for ages 2–12)

☐ **Severe Symptoms of Autism Spectrum Disorder**
 (37 and higher, 35 and higher for ages 2–12)

Symptom Level Compared to Individuals With Autism Spectrum Diagnosis

Percentile	T score	Raw scores		
		All ages	Ages 2–12	Ages 13 and older
>85	>70	>64	>54	>44
80	70	64	54	44
75	69	63.5	53.5	43.5
70	68	63	53	43
65	67	62.5	52.5	42.5
60	66	62	52	42
55	65	61.5	51.5	41.5
50	64	61	51	41

10	56	57	47	37
5	55	56.5	46.5	36.5
0	54	56	46	36
<0	53	55.5	45.5	35.5

Note: SEM = 0.25.

[10]

Generic measures

The Aberrant Behavior Checklist (ABC) is a behavior rating scale that is completed by the parent or primary caregiver of the individual with ASD and is a useful tool to evaluate ASD symptoms. The ABC includes some core deficit behaviors as well as associated symptoms of ASD. It has 58 items that are scored on five subscales that include irritability, agitation, crying, lethargy, social withdrawal, stereotypic behavior, hyperactivity, noncompliance and inappropriate speech. The ABC can be used for individuals between 5 and 54 years of age with an administration time of 10–15 min. The ratings are made with consideration to the child's behavior over the previous 4 weeks. Higher scores on the ABC indicate more severe problem behaviors. [8]

ABC Checklist							
Name _____				Date _____			
Time	Modifications of Setting/Events/Antecedents	Antecedent What was happening JUST prior to his behavior occurring?	Behavior	Strategies	Duration	Intensity	Consequence What happened after the behavior to resolve the problem?
8:30-9:00 Breakfast	Visual Timer	Alone	Did not follow directions	Student ignored	> 1 min.	1 LOW	Student lost privilege
9:00-9:30 SSP	Pre-writing	With Peers	Disrupting class	Used Proximity	1-5 min.	2	Went to her own desk
9:30-10:00 Recess	Nonverbal Reminder	Transferring	Making verbal threats	Gave a nonverbal cue	6-10 min.	3	Time away from others
10:00-11:00 Classroom	Verbal Reminder	Beginning a new activity	Physical threats	Gave verbal warning	11-15 min.	4	Sent to alternate classroom
11:00-11:15 Break	Used Proximity	Ending an activity	Physical threats	Redirected	16-20 min.	5 HIGH	Physical assist/prompt
11:15-11:45 Lunch	Redirected	Transition between classrooms	Put down name calling	Redirection	21-25 min.	1 & 2 Mild (disruptive but not dangerous)	Administration intervention
11:45-12:00 Classroom	Provided "Wait Time"	Participating in group	Profanity	Movement Break	26-30 min.	3 Moderate (Verbal physical threats and/or destructive to physical environment)	
12:00-12:30 Recess	Choice Given	Asked to do preferred activity	Verbally disrespectful	Directed to Calming Area	31-35 min.	4 & 5 Severe (Presents a physical danger to self and others)	
12:30-1:00 Classroom	Calming Activity	Asked to do a non-preferred activity	Destroying property	Used 1,2,3 Count	36-40 min.		
1:00-1:30 Recess	Assigned Area Within Group	Told/Asked "not to"	Throwing items	Processing	41-45 min.		
1:30-2:00 Recess	Provided Fidgets	Peer interaction	Working on academics	Hitting (peers adults)	46-50 min.		
2:00-2:15 Break	Encouraged To Use Her Words	Incident on Bus	Crying	Climbing Furniture	51-55 min.		
2:15-2:30 Classroom					56-60 min.		
2:30-3:15 Recess/Art					1-25 hours		
3:15-3:40 Dismissal					1-5 hours		
					1-75 hours		
					2-10 hours		
					>2 hours		

[14]

The **Child Behavior Checklist (CBCL)** is a standard measure of externalizing (i.e., aggressive, hyperactive, noncompliant and under controlled) and internalizing (i.e., anxious, depressive and overcontrolled) behavior problems using parents' ratings of 99 items. The total scaled scores (T-scores) can be used to report children's behavior problems including total problems, total internalizing and total externalizing scores. Parents should be able to complete it in 10 min. The CBCL focuses on associated symptoms, not core deficit behaviors. [8]

CHILD BEHAVIOR CHECKLIST FOR AGES 2-3

For office use only (2)

CHILD'S FULL NAME: ADAM ZAHN STERN AGE: 3 SEX: M RACE: WHITE

PARENTS' USUAL TYPE OF WORK, even if not working now (Please be specific - for example, such as mechanic, high school teacher, homemaker, retiree, other operator, other salesman, army sergeant, etc.): ACCOUNTANT

PARENTS' TYPE OF WORK: TEACHER

THIS FORM FILLED OUT BY: MELISSA ZAHN STERN

PLEASE fill out this form to reflect your view of the child's behavior even if other people might not agree. Feel free to print additional comments beside each item and in the space provided on page 2.

Below is a list of items that describe children. For each item that describes the child now or within the past 2 months, please circle the 2 if the item is very true or often true of the child, circle the 1 if the item is somewhat or sometimes true of the child, if the item is not true of the child, circle the 0. Please answer all items as well as you can, even if some do not seem to apply to the child.

0 = Not True (as far as you know) 1 = Somewhat or Sometimes True 2 = Very True or Often True

0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31 32 33 34 35 36 37 38 39 40 41 42 43 44 45 46 47 48 49 50 51 52 53 54 55 56 57 58 59 60 61 62 63 64 65 66 67 68 69 70 71 72 73 74 75 76 77 78 79 80 81 82 83 84 85 86 87 88 89 90 91 92 93 94 95 96 97 98 99

1. Acted or pains (without medical cause)

2. Acts too young for age

3. Afraid to try new things

4. Avoids looking others in the eye

5. Can't concentrate, can't pay attention for long

6. Can't sit still or restless

7. Can't stand having things out of place

8. Can't stand having things out of place

9. Chews on things that aren't edible

10. Clings to adults or too dependent

11. Consistently seeks help

12. Constipated, doesn't move bowels

13. Cries a lot

14. Cries to animals

15. Cries

16. Demands must be met immediately

17. Desires his/her own things

18. Desires things belonging to his/her family or other children

19. Diarrhea or loose bowels when not sick

20. Disobedient

21. Disturbed by any change in routine

22. Doesn't want to sleep alone

23. Doesn't answer when people talk to him/her

24. Doesn't eat well (describe):

25. Doesn't get along with other children

26. Doesn't know how to have fun, acts like a little adult

27. Doesn't seem to feel guilty after misbehaving

28. Doesn't want to go out of home

29. Easily frustrated

30. Easily jealous

31. Eats or drinks things that are not food - doesn't include sweets (describe):

32. Fears certain animals, situations, or places (describe):

33. Feelings are easily hurt

34. Gets hurt a lot, accident prone

35. Gets in many fights

36. Gets into everything

37. Gets too upset when separated from parents

38. Has trouble getting to sleep

39. Headaches (without medical cause)

40. Hides his/her breath

41. Hides his/her breath

42. Hurts animals or people without meaning to

43. Looks unhappy without good reason

44. Angry moods

45. Nausea, feels sick (without medical cause)

46. Nervous movements or twitching (describe):

47. Nervous, frightened, or tense

48. Nightmares

49. Overeating

50. Overweight

51. Overweight

52. Painful bowel movements

53. Physically attacks people

54. Picks nose, skin, or other parts of body (describe):

55. Plays with own sex parts too much

56. Poorly coordinated or clumsy

57. Problems with eyes (without medical cause) (describe):

58. Punishment doesn't change his/her behavior

59. Quickly shifts from one activity to another

60. Rash or other skin problems (without medical cause)

61. Refuses to eat

62. Refuses to play active games

63. Repeatedly rocks head or body

64. Resists going to bed at night

65. Resists going to bed at night

66. Resists going to bed at night

67. Resists going to bed at night

68. Resists going to bed at night

69. Resists going to bed at night

The **Vineland-II Adaptive Behavior Scales (VABS)** is useful to capture adaptive functioning. The VABS consists of four major domains: communication, socialization, daily living skills and motor skills (age <6 years). The VABS produces an adaptive behavior composite score, domain and subdomain scores, and age equivalents. It has supplementary norms for children with autism.

The VABS can be administered by either an interview that takes approximately 45–60 min for a clinician to complete with the primary caregiver of the individual with ASD, or a parent/caregiver

rating form. It does not require the presence of the individual being assessed. The VABS can be used across a broad range of conditions and focuses on the current level of functioning. [8]

Case Study: Results

Domain Standard Scores		Subdomain v-Scores
Communication = 100 <i>Strength</i>	Adequate	Receptive = 16
		Expressive = 15
		Written = 14
Daily Living Skills= 93	Adequate	Personal = 14
		Domestic = 14
		Community = 14
Socialization = 85	Moderately Low	Interpersonal Relationships = 12
		Play and Leisure Time = 15*
		Coping Skills = 10*
Motor Skills = 91	Adequate	Gross = 14
		Fine = 13
<u>Adaptive Behavior Composite = 90</u>		

[15]

The Social Responsiveness Scale (SRS) is a 65-item rating scale completed by a parent that assesses severity of symptoms associated with ASDs. The SRS provides a picture of a child's social impairments, yielding an overall severity score (a higher score corresponds to greater impairment). It assesses social awareness, social information processing, capacity for reciprocal social communication, social anxiety/avoidance, and autistic preoccupations and traits. It is appropriate for use with children aged 4–18 years. The SRS distinguishes children with ASDs from other child psychiatric conditions. [8]

The screenshot shows the SRS-2 Profile Sheet form, which is a parent report. The form includes a header with the WPS logo and the title 'SRS-2 Profile Sheet'. Below the header, there is a section for 'Parent Report' with fields for the child's name, age, sex, and the parent's name. The form also includes a section for 'Total Score Results' with a table showing the total score and its corresponding range. The 'Total Score Discussion' section provides a detailed explanation of the score and its implications. The 'DSM-5 Compatible Scales' section shows scores for various subdomains, including Social Awareness, Social Information Processing, and Social Anxiety/Avoidance. The form is designed to be completed by a parent and provides a comprehensive overview of the child's social responsiveness.

[16]

Restricted, repetitive and stereotyped behaviors are characteristic of the fixated behavior patterns that occur in children with ASDs. The behaviors can be measured using the **Repetitive Behavior Scale**

– **Revised (RBS-R)**. The RBS-R is a quantitative, empirically derived clinical rating scale. It measures both the presence and severity of repetitive behaviors, and provides a continuous measure of the full spectrum of repetitive behaviors. Parents are asked to rate their children’s behavior on 42 items. The measure contains six subscales: stereotyped behavior, self-injurious behavior, compulsive behavior, routine behavior, sameness behavior and restricted behavior. A total score is generated, with higher scores indicating more restricted, repetitive and stereotyped behaviors. The RBS-R measures some of the core deficit behaviors as well as associated behavior symptoms of ASD. [8]

RBS-R Subscales by Bishop et al. Cognitive measures

Cognitive ability for children with ASDs can range from low to high across any range of severity. Developmental patterns in children with ASDs can be influenced by age and IQ. For example, lower IQ may interact with the severity of the child’s autism to increase the need for assistance with activities of daily living. [8]

The Stanford–Binet Intelligence Scales (5th Edition), the Mullen Scales, the Bayley Scales and the Wechsler Intelligence Scales have good psychometric properties. **The Stanford–Binet Intelligence Scale** is an individually administered formal test of general intelligence used with individuals aged 2–89 years and yields an IQ value. In young children, the **Mullen and the Bayley Scales** are commonly used measures that examine the child’s cognitive development. **The Mullen Scale** is an individually administered comprehensive measure of cognitive functioning for children from birth through 68 months of age and yields a cognitive composite score, **the Early Learning Composite**. **The Bayley Scale** is an individually administered comprehensive measure of cognitive functioning for children from birth through 42 months of age and produces a cognitive score. **The Wechsler Intelligence Scales for Children – Fourth Edition** is appropriate for children and adolescents aged 6–16 years. It provides four index scores (verbal comprehension, perceptual reasoning, working memory and processing speed) and the full-scale IQ. All four cognitive measures yield an overall composite score that is expressed as a standard score with a mean of 100 and standard deviation of 15 to describe an individual’s cognitive ability and are comparable measures of general intelligence. [8]

The behavior problems of children with ASDs can be categorized into two groups: core deficit behaviors and associated symptoms. The associated symptoms may include hyperactivity/inattention, aggression (i.e., tantrums, self-injury, anxiety and emotional lability), obsessive–compulsive-like behaviors and sleep disorders. These impairments impact a child’s QoL and HRQL. [8]

The Paediatric Quality of Life Inventory™ (PedsQL) consists of 23 items that are designed for use in children aged 2–18 years. PedsQL was able to distinguish between children with Asperger's disorder and healthy children. The HRQL and cognitive functioning scores were significantly lower in children with Asperger's. [8]

The Functional Status II-R (FS II-R) was designed to measure behavioral manifestations of an illness or condition that interferes with a child's performance of the full range of age-appropriate activities. [8]

Although existing **HRQL** instruments have limitations in measuring HRQL for children with ASDs, they have the potential to capture some relevant behavior problems. For example, a number of the question items of the FS II-R such as play games, restless, trouble with task and sleep are relevant to ASD conditions. HRQL measures can help to evaluate the influence of interventions and services. There are several preference-based HRQL instruments including the **Quality Well-Being (QWB)**, the **EuroQol five-dimension questionnaire (EQ-5D)**, the **6-dimension Short Form (SF-6D)**, the **Health Utilities Index (HUI)** and the **Assessment of Quality of Life (AQoL)**. [8]

The CHU9D was specifically developed for a paediatric population aged 7–11 years. It contains nine questions covering nine dimensions of HRQL (worried, sad, pain, tired, annoyed, school-work, sleep, daily routine and activities). The CHU9D focuses on current (today/last night) health status with five response levels in each question. [8]

If severity of autism is defined based on an individual's ability to function, then common co-occurring impairments that are not necessarily core features of autism, such as cognitive deficits and challenging behaviors, need to be considered, because these factors can have a major impact on functioning.

Gilliam Autism Rating Scale is one of the most widely used instruments for the assessment of Autism Spectrum Disorder in the world. The GARS-3 assists teachers, parents and clinicians in identifying autism in individuals and estimating its severity. The instrument consists of 56 clearly stated items describing the characteristic behaviours of persons with autism. The items are grouped into six subscales: Restrictive, Repetitive Behaviours, Social Interaction, Social Communication, Emotional Responses, Cognitive Style, and Maladaptive Speech. [4]

The Autism-Spectrum Quotient Test (AQ) is a diagnostic questionnaire designed to measure the expression of Autism-Spectrum traits in an individual, by his or her own subjective self-assessment. [3]

<https://psychology-tools.com/test/autism-spectrum-quotient>

The Pervasive Developmental Disorder Behavior Inventory PDDBI is an assessment designed to measure the effectiveness of treatments for children with significant developmental disabilities, including autism spectrum disorder (ASD). The test is an informant-based ratings scale that focuses on behavioral challenges, key skills and abilities. [2]

These approaches and instruments are incredibly valuable for characterizing autism; however, as highlighted by a 2009 study, there are limitations to each approach. For example, many of the rating scales correlate strongly with an individual's intelligence quotient (IQ), which reduces the focus on autism core symptoms. However, the **SRS**, which is less impacted by IQ, focuses primarily on social communication and does not include direct observation of the child. [11]

Summary scores on the **ADI-R** have often been used as severity metrics for core autism symptoms, but the ADI-R was not developed as a measure of severity. For example, higher scores generally indicate greater impairment, but non-verbal children are not administered a portion of the test, restricting the utility of the communication domain. Scores also vary based on the child's IQ and age. [11]

Similar complications arise when researchers use the **ADOS** summary scores. These are influenced by age and language level, which determine which version, or module, of the test is administered, limiting the ability of the ADOS to generalize across individuals. [11]

The newest approach, a **calibrated severity score** that is based on raw ADOS scores, attempts to provide a standardized, clinician-based metric that controls for language ability and age when determining autism severity. [11]

These measures have significantly advanced our understanding of autism, although a precise characterization of severity has remained elusive. This is to be expected, given the fact that the disorder changes during development and is very heterogeneous. The measures are also used in multiple contexts, varying from clinical to research settings. [11]
